IDEAS AND SUGGESTIONS

Regarding the use of

ANDREWS Ready Reference RADIO LOG

You will always find the information in the ANDREWS RADIO LOG to be accurate, authoritative and reliable and that its use adds greatly to the pleasure received from any kind of radio receiving set.

Ready Reference may be made to any Wave length in the Dial Reading section (pages 2 to 9) as the stations in this section start at the lowest wavelength in meters (highest in kilocycles) and are numbered consecutively in red.

Ready Reference may be made to any Call Letter or City in the Dial Reading section by referring to the same red number in this section that precedes every station in either the Call Letter index (pages 10 and 11) or City index (pages 12, 13, 14, and 15).

Although stations of the same wave length are supposed to have the same dial readings, frequently they will vary slightly. This is due to no fault of yours or your set's and is true of sets with one dial or with two or more dials. For this reason we would suggest that you log each station separately regardless of how many others are on the same wave length.

You can find the approximate position of any station on your dial by using an already logged station as a guide because the stations in the ANDREWS Ready Reference RADIO LOG are listed in the same order that you will receive them on your set.

For instance,—using your dial readings of stations 186 and 185 (same wave length) as a guide, the next dial readings towards zero on your set will be that of stations 184, 183 and 182 (same wave length) and next to that on your set will be the dial readings of stations 181 and 180 (same wave length) and so on. Turning your dials in the opposite direction works out the same way, bearing in mind that stations of the same wave length will have approximately the same dial readings.

If your dials are calibrated and so indicated for kilocycles, use the column in the ANDREWS RADIO LOG marked "kilocycles" instead of the one ordinarily used, marked "meters".

You can use the ANDREWS READY REFERENCE LOG to check the efficiency of your receiving set. Suppose, for instance, that you already have picked-up and logged station No. 254 and station No. 268. When they are "on the air", the thirteen stations shown in the ANDREWS RADIO LOG between stations No. 254 and 268 should be picked up by your set between the dial readings of these two stations.

This method of testing may be applied between any two dial readings and is always accurate unless the station or stations in question are not broadcasting on their allotted wave length shown in this log.

Only 250 Watt Stations and larger are shown because reception from stations of less power is largely local to each smaller station's immediate surrounding territory.

However, blank lines are left on each page for you to fill in the call letters, location, wave length and wattage of any station not listed here which you may receive or which changes its wave length, and we would suggest your using the lines nearest printed stations of the same wave length for this purpose.

According to government records available to us, the ANDREWS Ready Reference RADIO LOG was corrected up to February 5, 1926, the day it went to press.

ADDITIONAL COPIES OF THIS LOG MAY BE OBTAINED FROM
